The RTI® DDS Toolkit for LabVIEW allows you to reliably and securely exchange data across highly distributed and heterogeneous systems. Built on RTI Connext DDS, the market-leading implementation of the open standard Data Distribution Service (DDS) for Real-Time Systems, the RTI DDS Toolkit seamlessly exchanges data between LabVIEW VIs and other DDS compliant applications.

HIGHLIGHTS

- Easy-to-use data communications infrastructure
- Built on the DDS open standard for secure, real-time systems
- Deployable to NI Linux Real-Time Controllers
- Works with RTI Connext Tools for integrating and debugging distributed applications
- Bundled with LabVIEW 2017 and higher

OVERVIEW

The RTI DDS Toolkit for LabVIEW helps you overcome several distributed system challenges:

- Deliver low latency and high throughput while scaling to large systems
- Provide data privacy, integrity and access control
- Reliably publish data to many subscribers, including streaming data
- Easily integrate LabVIEW with other applications

The RTI DDS Toolkit provides a set of subVIs for publishing and subscribing to data. They allow you to easily exchange data between LabVIEW VIs and other applications that use DDS.

The RTI DDS Toolkit, including support for LabVIEW on NI Linux Real-Time, is integrated with LabVIEW 2017 and higher in the Block Diagram / Data Communication Palette. You can install it by clicking on the ‘Install’ shortcut, or directly from the VI Package Manager.

RICH ECOSYSTEM

The RTI DDS Toolkit works seamlessly with the RTI Connext product line. Capabilities include:

- Connext DDS libraries and SDK for all major programming languages, operating systems and CPU families, including CompactRIO

powered by

LabVIEW

rti.com
• Data-aware routing between networks and security domains
• Tools for integrating, debugging and monitoring distributed systems
• Real-time data recording for post-mission analysis and debugging
• Replay of recorded data for testing and simulation
• Adapters and adapter SDK for easy integration with other protocols and existing applications
• Transports for low-bandwidth networks such as satellite and radio
• Bi-directional database integration for data sharing between SQL and DDS applications
• Bi-directional integration with Microsoft Excel
• REST/HTTP interface for web applications and scripting

**OPTIMIZED FOR MISSION-CRITICAL REAL-TIME SYSTEMS**

The RTI DDS Toolkit for LabVIEW employs a completely decentralized communications architecture. It does not require any servers, services or message brokers. The messaging infrastructure is completely embedded in the RTI subVIs, which communicate peer-to-peer. This delivers:

- Minimum latency because there is no intermediate software or gratuitous network hops
- Maximum throughput and scalability because there is no service acting as a bottleneck or choke point
- Non-stop availability because there is no single point of failure
- Easy embedding because there are no services that must be started and administered

Automatic discovery eliminates the need for deployment-time configuration. Applications are plug-and-play, facilitating use in dynamic networks. The Connext DDS middleware automatically discovers and routes data between matching publishers and subscribers at runtime; systems are self-forming and self-healing.

Multicast support provides highly scalable one-to-many and many-to-many data distribution. Messages only have to be sent over the network once, regardless of the number of subscribers. The network switch automatically routes data to all subscribing nodes. This maintains low latency even for very broad data distribution. Since network-level multicast is unreliable, Connext DDS includes an optional reliability protocol optimized for real-time behavior.

Fine-grained control over messaging Quality of Service (QoS) and security allows you to optimize tradeoffs between latency, throughput, CPU overhead and network overhead. The security, timeliness and reliability of data delivery are configurable per-stream and per-application. This eases integration of applications with disparate performance needs such as real-time and IT applications.

**ABOUT RTI**

Real-Time Innovations (RTI) is the Industrial Internet of Things (IIoT) connectivity company. The RTI Connext® Databus is a software framework that shares information in real time, making applications work together as one, integrated system. It connects across field, fog and cloud. Its reliability, security, performance and scalability are proven in the most demanding industrial systems. Deployed systems include medical devices and imaging; wind, hydro and solar power; autonomous planes, trains and cars; traffic control; Oil and Gas; robotics, ships, and defense.

RTI lives at the intersection of functional artificial intelligence and pervasive networking™.

RTI is the largest vendor of products based on the Object Management Group (OMG) Data Distribution Service™ (DDS) standard. RTI is privately held and headquartered in Sunnyvale, Calif.
